Contens	1
Overview and Features of the Senser Xtreme	2
PCB layout / Installation	3
Dimming with PWM.....	4
Leds, voltages, currents	5-7
Dimensions, temperature sensor, increase output current to 3A (applies to version 1).....	8-9

The Senser Xtreme R.2 is the complement to our proven Senser V2. It is a very powerful boost constant current source that sets new standards. The (input) current can be up to 8 amps, so you can already operate with very low input voltage, a large number of LED's with high currents. To be as flexible as possible in your applications, many different output currents are set by solderbridges but other currents through add / change the measuring resistors possible. The possibilities are endless, please refer to our connection examples.

The Senser Xtreme has an external input which allows dimming by pulse width modulation. Either you use this input for our final dimmer modules or your own development.

Specifications / Features:

- ✓ High power switch mode boost constant current source (step-up)
- ✓ No longitudinal controller!
- ✓ 5-40V / DC input voltage range / 8 amps! maximum current (on input side)
- ✓ Output voltage to 65 volts (Equivalent to approximately 20 high-power white LEDs, other colors accordingly more)
- ✓ Output currents selectable by solderbridges or other currents are possible (tested up to 3A)
- ✓ Factory output currents:
200/350/500/550/700/850/1000/1050/1200/1350/1500/1550/1700/1850/2050mA up to 3050mA
- ✓ More than 100 Watt power Led
- ✓ Soft-start (to prevent any spikes when turning on)
- ✓ Efficiency depending on input voltage up to 97%
- ✓ High-quality components, ceramic chip capacitors instead of tantalum / electrolytic capacitors
- ✓ Built-in temperature sensor (power reduction at high temperature)
- ✓ Qualitative two-sided board, thermal management design optimized 70µm copper layer!
- ✓ For lighting projects of any kind, such as Lights, lamps, flashlights, cars, signs, lighting, lighting engineering, etc.
- ✓ Extremely small dimensions: 28mm diameter x 16mm height
- ✓ External PWM and External shutdown and turnon input (max. 10V/DC)
- ✓ Dimming and controllable with our Led Stripe V4, NanoDim V2 or µ-Dim

Layout:

Connecting:

In principle, the following procedure is recommended:

Connect the LEDs, multiple LED's are connected in series or parallel *.

Pay attention to the input side on sufficiently thick cable. The current can be up to 8A!

Maybe you need to cool the driver, attach him if necessarily with an electrically insulating material such as Thermal pad on a metal surface / heat sink.

- 1) Close the desired solderbridge(s) to set the output current. **(The set current is derived from the sum of all enclosed solder bridges)**
- 2) Connect the power supply.
**It is important to ensure that the input voltage \leq Total-Led voltage. (Boost-principle).
If not the LED(s) get to much voltage and can damage!**
- 3) Turn on the power supply

* For parallel-connected LEDs the voltage spread corresponding to the number of strands. You have for example the solderbridge to 700mA and two LEDs connected in parallel, although the voltage distributed 50/50%, but by the fluctuations of a typical diode, the LED current is distributed in such two parallel lines is not exactly 50/50%.

If in a parallel connection one strand lose, the current is distributed to the remaining (n) Led strands.

Dimensions:

Integrated temperature sensor:

The integrated temperature sensor starts at around 75 degrees Celsius to decrease the output current linearly. If the temperature decreases, the output current rises again.

Increase output current to 3A:

This step is necessary only for version 1, version R.2 can be set to 3A of the solder bridge.

The output current can be increased to 3A without further notice. Use a 0.1 ohm / 1% / 0805 size SMD resistor in parallel to the existing resistance which sits at the 200mA soldered bridge and solder it on. Unsolder the coil, it is advantageous to work better.

The 200mA bridge acts as a 1.2A bridge now. To get 3 Ampere, all solderbridges are closed. The needed resistors we can deliver.

We tested this setting with up to 8 pcs. Led at 3 Ampere.
